

Shakespeare Speaks: Complete Agents Inventory

Taxonomy of Specialized Agents in the System Architecture

Introduction: This document inventories and describes the ten (10) distinct agents running within the Shakespeare Speaks architecture. These include chat-specific agents orchestrated by the Agent Development Kit (ADK) graph, pre-flight security guardrails, and REST-based background processors. Together, they form a coordinated, decoupled multi-agent ecosystem.

1. Security Guardrail Agent (SecAgent)

- **Description:** Acts as the system gatekeeper. It intercepts all incoming text queries in a pre-flight model call, using a specialized safety prompt to detect and block semantic prompt injections or hijack attempts before they reach core agents.
- **Agent Type:** *Inline Guardrail (Pre-flight)* | **Tools Used:** *N/A (Uses specialized safety prompt configuration)*

2. Intent Routing Agent (intent_analyzer)

- **Description:** The entry node of the ADK chat graph. It evaluates user inputs, parses them against a strict Pydantic schema (RouteSelection), and directs the conversation flow to the correct specialized subagent.
- **Agent Type:** *ADK Graph Coordinator* | **Tools Used:** *RouteSelection (Pydantic routing contract)*

3. Corpus Reader Agent (corpus_reader_agent)

- **Description:** Translates natural language questions about play contents into structured SQL. It queries play dialogues from the SQLite database and presents the matches to the user.
- **Agent Type:** *ADK Subagent* | **Tools Used:** *query_play_dialogue (SQL Translator & SQLite Reader)*

4. Corpus Searcher Agent (corpus_searcher_agent)

- **Description:** Performs fast text-pattern queries inside the SQLite database to locate specific keywords, phrases, or characters across the entire Shakespeare dataset.
- **Agent Type:** *ADK Subagent* | **Tools Used:** *search_shakespeare_text (SQL Search Tool)*

5. History Scholar Agent (history_agent)

- **Description:** Analyzes questions about Shakespeare's biography, contemporary playwrights, and the Elizabethan/Jacobean theatrical era using local historical archives.
- **Agent Type:** *ADK Subagent* | **Tools Used:** *read_historical_context (Local Markdown file reader)*

6. Scholarship Agent (scholarship_agent)

- **Description:** Searches the web for modern academic findings, archaeological discoveries, and Shakespearean research papers, providing grounded citations in its responses.
- **Agent Type:** *ADK Subagent* | **Tools Used:** *search_web_for_scholarship (Gemini Google Search Grounding)*

7. Advice Agent (advice_agent)

- **Description:** Dispenses nature-focused philosophical advice by drawing analogies between seasonal patterns, gardening, and themes in Shakespeare's tragedies (styled after Chauncey Gardiner).
- **Agent Type:** *ADK Subagent* | **Tools Used:** *N/A (Uses parametric literary and character knowledge)*

8. General Agent (general_agent)

- **Description:** Handles conversational user requests and chit-chat that fall outside the domain of the specialized subagents, acting as a fallback responder.
- **Agent Type:** *ADK Subagent (Fallback)* | **Tools Used:** *N/A (Standard parametric conversational response)*

9. Current Events Agent (CurrentEventsAgent)

- **Description:** A background caching agent. It runs in a parallel loop to fetch top stories, match them with Shakespearean quotes and citations, and cache them in local JSON files.
- **Agent Type:** *Background Caching Worker* | **Tools Used:** *Gemini Search Grounding + Structured Schema Parser*

10. News Analysis Agent (NewsAnalysisAgent)

- **Description:** Takes news headlines and excerpts (from cached files) and writes a detailed, multi-paragraph Shakespearean literary critique and essay commentary in Markdown.
- **Agent Type:** *Inline Essay Generation Agent* | **Tools Used:** *Gemini Writer (Chauncey Gardiner + Philosopher persona)*
